# GigaVUE Cloud Suite for VMware

Intelligent Traffic and Application Visibility with Comprehensive Virtualization and Automation for VMware Environments

Certified integration of GigaVUE Cloud Suite™ with VMware vCenter and NSX-T.

Key Features and Benefits

Traffic acquisition and local workload-based processing

- Reduce application downtime
- Automatically scale vTAPs up/down on demand
- Acquire all East-West VM workload traffic
- Minimal VM impact with DPDK for high performance and capacity
- Acquire traffic using tunnel-as-a-source, including from virtual TAPs in Ericsson and Nokia environments

Traffic aggregation, expanded processing, and distribution to tools

- Flexibly send traffic to aggregating visibility nodes or directly to tools
- Selectively process traffic with GigaSMART® Application Intelligence
- Increase overall efficiency by eliminating duplicated packets
- Filter any packet content by searching for patterns based on strings and offsets or PCRE Regular Expression

Centralized multi-cloud management and orchestration

- Realize a fully automated environment including support for vMotion
- Automatically instantiate and configure GigaVUE V Series using NSX-T Dynamic Service Insertion
- ATS automatically selects VMs and interfaces to simplify horizontal scaling configuration
- Single-pane-of-glass management, orchestration, and visualization across multiple clouds

Limitations of physical networking and traditional security in an increasingly dynamic virtual world create artificial barriers to fast provisioning of networking and security services and simplified network operations. Manual provisioning and fragmented management interfaces reduce efficiency and limit the ability of enterprises to rapidly and securely deploy, move, and scale applications and data to meet business demands.

Paramount to securing and monitoring the software-defined data center (SDDC) infrastructure is the ability to have an immediate and rich understanding of activity in your end-to-end network. To accomplish this, security, application, and network monitoring solutions require traffic visibility of both virtual and physical infrastructure. This requirement can be challenging.

Pervasive visibility into the data center enables application and security monitoring tools to analyze congestion points, security threats, and application behavior. This helps automate, secure, and optimize the data center network.

GigaVUE Cloud Suite™, a key component of the Gigamon Deep Observability Pipeline, is a fully VMware-certified deep observability pipeline that acquires, optimizes, and distributes selected traffic to security and monitoring tools. This enables enterprises and service providers to extend their security posture and network monitoring to VMware and accelerate the time to detect and mitigate threats and operational issues, while helping to assure

compliance. This platform supports Gigamon Application Intelligence to automatically identify thousands of applications, granularly drop irrelevant content, and send specific app traffic to specific tools. Additionally, advanced L4–7 metadata is generated to provide contextual insights.

Accelerate Application Migration to the Cloud

Using GigaVUE Cloud Suite for VMware, security architects can ensure an effective security posture in the private and hybrid cloud, thereby accelerating the onboarding of applications to VMware.

GigaVUE Cloud Suite for VMware, as shown in Figure 1, acquires traffic with a single, lightweight V Series VM installed on each of the various hypervisors running workloads of interest. The platform integrates with VMware's vCenter and/or NSX-T APIs to discover the cloud infrastructure. It then deploys the V Series instances that copy, optionally process, and either transmit traffic to a second stage V Series or GigaVUE HC Series for aggregation and expanded processing, or send traffic directly to tools. First-stage V Series visibility nodes are capable of processing all GigaSMART data de-duplication applications, Application Metadata Intelligence, as well as applying multiple filtering
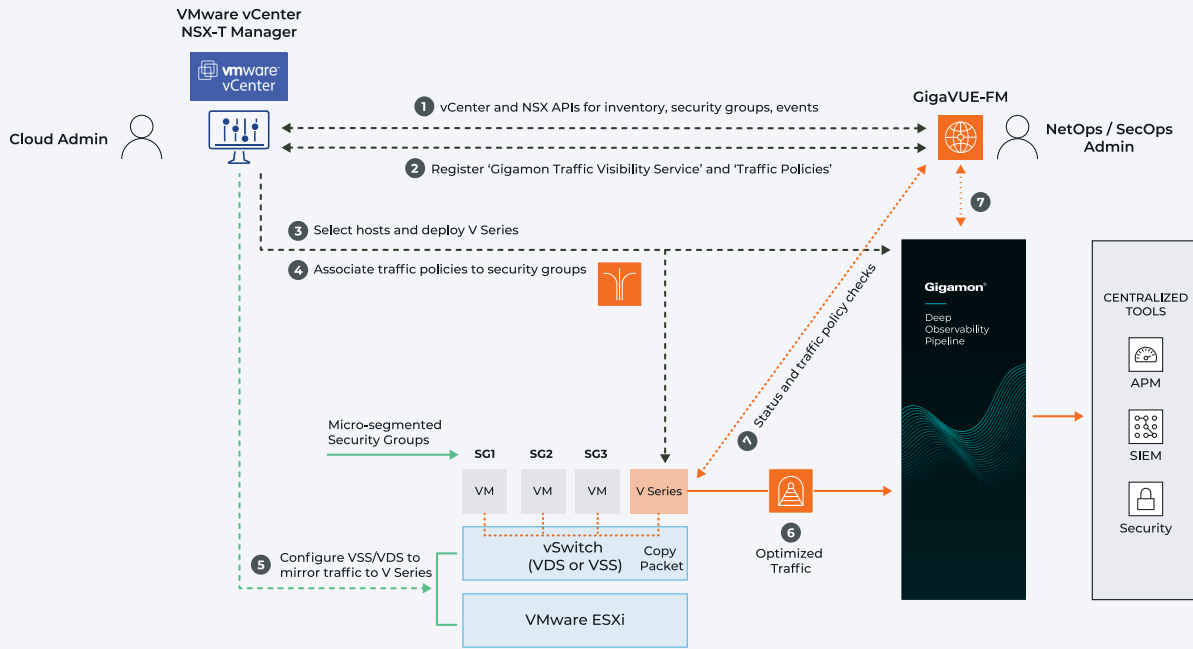

Figure 3. Straightforward seven-step process for provisioning, configuration, and monitoring.

techniques, including Application Filtering Intelligence and adaptive packet filtering. Second-stage V Series collect aggregated traffic from the desired hosted workloads and apply additional advanced traffic intelligence prior to sending selected traffic to security and monitoring tools.

With this solution, you can take advantage of:

• **Complete infrastructure virtualization with automation:** The entire environment, including the Gigamon Deep Observability Pipeline, can be implemented in software with automated orchestration tools. This provides superior agility with minimal manual interventions and allows proactive architectural modifications to enable maximum efficiency.

• **Increased security:** Centralize visibility for security and performance monitoring of all projects in an organization. Network and security operations and incident response teams can use network and application visibility enhanced with L4–7 metadata

attributes to rapidly detect and respond to threats, vulnerabilities, compliance violations, and operational issues across the infrastructure. Leveraging over 7,000 application-aware metadata attributes enables SIEMs to find and help resolve numerous security threats and vulnerabilities.

• **Reduced data costs:** Optimize costs with pervasive visibility for security and monitoring without increasing load on compute instances as more security and monitoring tools are deployed. Acquire traffic once from compute instances and leverage Application Intelligence to filter out irrelevant traffic and minimize the burden on tools; their efficiency and effectiveness are greatly improved.

• **Operational efficiency:** One common software-based platform for visibility across the entire IT environment enables consistent insight in VMware. Acquire network traffic with minimal impact to the host's utilization and apply traffic intelligence before distributing to multiple security and monitoring tools for analysis.

- **Operational agility:**
  - Rapidly detect changes in projects being monitored
  - Automatic Target Selection: Automatically extract network traffic of interest anywhere in the infrastructure being monitored, without having to specify the target compute instances to monitor
  - Flexibility to perform the analysis of traffic anywhere
  - Automate and orchestrate visibility using a tight coupling between Fabric Manager's open REST APIs and VMware's vCenter and NSX-T
  - Easily upgrade all V Series instances within multiple ESXi/NSX-T monitoring domains simultaneously to newer versions while retaining the same policy configurations

GigaVUE Cloud Suite Components

GigaVUE V Series: Data Acquisition

For traffic acquisition and optional GigaSMART-based processing — including Application Intelligence — V Series are provisioned as data acquisition VMs and deployed as a VMware ESXi guest on each hypervisor. These instances receive copied packets from each of the other VMs on the same server through service insertion on a virtual switch (VDS or VSS). They may be configured to partially or fully process traffic and send either directly to the end security or monitoring tools or to a V Series or HC Series for aggregation, expanded processing, and distribution.

Key capabilities and benefits include:

- Single, lightweight VM per hypervisor minimizes impact on compute nodes and delivers high throughput by leveraging DPDK
- Locally process GigaSMART apps, such as all application filtering and application metadata generation, and data de-duplication, to offload tools, and utilize Flow Mapping® for optimized flows and IPsec tunneling for secure transmissions

- Automatic instantiation, configuration, vMotion-based VM relocation, and monitoring via vCenter and NSX-T with fabric manager enables operational simplicity
- Dynamically select VM and network interfaces based on the rules defined in the inclusion and exclusion maps in the monitoring session to enhance filtering and granularly target specific workloads

GigaVUE V Series: Data Aggregation

For traffic aggregation and enhanced processing, V Series can also be provisioned as visibility nodes and centrally deployed in host or cluster (NSX-T) formats. These instances receive copied packets from the data acquisition V Series or from other devices such as virtual TAPs from Ericsson and Nokia, via tunnel-as-a-source methods, combine these streams, and apply additional data de-duplication GigaSMART applications — including application filtering and application metadata generation — to optimize flows and distribute to the appropriate tools.

Key capabilities and benefits include:

- Deployment of a fully virtualized architecture to realize software-defined data centers (SDDC)
- Flexible filtering mechanism with elastic monitoring session support for traffic filtering based on any header or payload content, as well as on more than 3,500 identified applications, packet manipulation, and forwarding
- Rich optimization to reduce load on operational tools, accelerate time to troubleshoot and remediate network and security issues
- Automatically instantiate unlimited V Series instances in a cluster without extra expense, to ensure performance
- Supports multiple ingress protocols including VXLAN, ERSPAN, L2GRE, and REP (raw endpoint) and L2GRE for egress
- Maintain regulatory compliance by masking sensitive and private data
- Enhanced visibility into tunneled application flows

GigaVUE Physical Appliances: Data Aggregation

Traffic aggregation, intelligence, and distribution can alternatively leverage the GigaVUE HC Series visibility nodes, which are deployed within the visibility tier. Advanced transformations on the aggregated network traffic can be performed before it is delivered to the tools.

Key capabilities and benefits include:

- Automatically identify over 3,500 applications using deep packet inspection; selectively filter and distribute to the proper security and monitoring tools

- Generate more than 7,000 application-metadata attributes and send to SIEM and other tools to further refine distribution rules, troubleshoot issues and identify security risks

- Transform headers: Modify content in the header (L2–L4) to ensure security and segregation of sensitive information

- Handle sensitive data, including slicing, sampling, and masking packets to optimize traffic sent to tools, reducing tool overload

GigaVUE-FM: Management and Orchestration

GigaVUE-FM handles centralized orchestration and management. Using RESTful APIs and tight coupling to VMware vCenter and NSX-T, GigaVUE-FM directs the automatic instantiation and configuration of V Series for data acquisition on each server with workloads to be scrutinized, as well as those used for aggregation. GigaVUE-FM monitors and controls operations to simplify network management. To deploy V Series nodes, FM can either be selected as the web server that provides uploaded image versions via a connection to NSX-T Manager, or an external image server URL can be used (default option).

Key capabilities and benefits include:

- Enable SecOps and NetOps teams to automate the selection, filtering, and forwarding of the ever-growing East-West virtual traffic for security and monitoring analytics

- Use VMware NSX Data Center Dynamic Service Insertion to associate visibility policies with security groups, thereby providing continuous and automated traffic visibility for applications as they scale up

- Direct the V Series for data acquisition to copy their micro-segments' traffic, process accordingly, and send it to V Series or HC Series for aggregation and further processing, or send directly to tools

- Track vMotion events across distributed resource scheduler (DRS) and high-availability (HA) cluster environments to couple visibility policies to the monitored VMs and migrate them with the VMs as they move across physical hosts

- Dynamically adjust traffic received or orchestrate new traffic policies

- Automatically discover and display end-to-end topology and view the visibility tier and vCenter VM instances as a topology

- For visibility tiers based on physical appliances, configure and monitor GigaVUE HC Series and forwards traffic to tools

Works with NSX-T to support Host mode (one V Series node per host) or Cluster mode (n V Series nodes per cluster)

Minimum Requirements for GigaVUE Cloud Suite Components

Solution Component	Minimum per Host	Description
GigaVUE V Series	Small: 4 x vCPU, 8GB RAM Medium: 8 x vCPU, 16GB RAM Large: 16 x vCPU, 32GB RAM 10xvNICs	**vNICs (three or more):** · Maximum: 10 network adapters · Network Adapter 1; V Series management port · Network Adapter 2; V Series tunneling port to on-premises physical or virtual visibility fabric nodes or to tools · Network Adapters-ESXi 3–10; V Series network ports · Network Adapters-NSX-T: 3 for V Series network ports
GigaVUE-FM	4 x vCPU, 16GB RAM, 40GB root disk	**Fabric manager:** · Needs to be able to access the V Series nodes to issue the commands · Automatically spins up additional V Series for aggregation nodes based on a predefined configuration in the user interface* For on-premises GigaVUE-FM requirements and ordering information, please refer to the GigaVUE-FM data sheet.

*Based on the number of virtual TAP points, GigaVUE V Series nodes will be auto-launched by GigaVUE-FM.

Ordering Information

GigaVUE Cloud Suite for VMware can be purchased as a tiered data licensing subscription from Gigamon. The table below lists the SKUs for procurement

Part Number	Description
VBL-50T-BN-CORE	Monthly Term license for CoreVUE software up to 50TB per day in V Series for cloud and virtual environments. Capabilities included: Advanced Tunneling, Slicing, Masking, Advanced Load Balancing. Min Term is 12 months. Includes bundled Elite-Plus Support.
VBL-250T-BN-CORE	Monthly Term license for CoreVUE software up to 250TB per day in V Series for cloud and virtual environments. Capabilities included: Advanced Tunneling, Slicing, Masking, Advanced Load Balancing. Min Term is 12 months. Includes bundled Elite-Plus Support.
VBL-2500T-BN-CORE	Monthly Term license for CoreVUE software up to 2,500TB per day in V Series for cloud and virtual environments. Capabilities included: Advanced Tunneling, Slicing, Masking, Advanced Load Balancing. Min Term is 12 months. Includes bundled Elite-Plus Support.
VBL-25KT-BN-CORE	Monthly Term license for CoreVUE software up to 25,000TB per day in V Series for cloud and virtual environments. Capabilities included: Advanced Tunneling, Slicing, Masking, Advanced Load Balancing. Min Term is 12 months. Includes bundled Elite-Plus Support.

Part Number	Description
VBL-50T-BN-NV	Monthly Term license for NetVUE software up to 50TB per day in V Series for cloud and virtual environments. Capabilities included: CoreVUE for V Series, De-duplication, NetFlow. Min Term is 12 months. Includes bundled Elite-Plus Support.
VBL-250T-BN-NV	Monthly Term license for NetVUE software up to 250TB per day in V Series for cloud and virtual environments. Capabilities included: CoreVUE for V Series, De-duplication, NetFlow. Min Term is 12 months. Includes bundled Elite-Plus Support.
VBL-2500T-BN-NV	Monthly Term license for NetVUE software up to 2,500TB per day in V Series for cloud and virtual environments. Capabilities included: CoreVUE for V Series, De-duplication, NetFlow. Min Term is 12 months. Includes bundled Elite-Plus Support.
VBL-25KT-BN-NV	Monthly Term license for NetVUE software up to 25,000TB per day in V Series for cloud and virtual environments. Capabilities included: CoreVUE for V Series, De-duplication, NetFlow. Min Term is 12 months. Includes bundled Elite-Plus Support.
VBL-50T-BN-SVP	Monthly Term license for SecureVUE Plus software up to 50TB per day in V Series for cloud and virtual environments. Capabilities included: NetVUE for V Series, App Metadata Intelligence, App Filter Intelligence. Min Term is 12 months. Includes bundled Elite-Plus Support.
VBL-250T-BN-SVP	Monthly Term license for SecureVUE Plus software up to 250TB per day in V Series for cloud and virtual environments. Capabilities included: NetVUE for V Series, App Metadata Intelligence, App Filter Intelligence. Min Term is 12 months. Includes bundled Elite-Plus Support.
VBL-2500T-BN-SVP	Monthly Term license for SecureVUE Plus software up to 2,500TB per day in V Series for cloud and virtual environments. Capabilities included: NetVUE for V Series, App Metadata Intelligence, App Filter Intelligence. Min Term is 12 months. Includes bundled Elite-Plus Support.
VBL-25KT-BN-SVP	Monthly Term license for SecureVUE Plus software up to 25,000TB per day in V Series for cloud and virtual environments. Capabilities included: NetVUE for V Series, App Metadata Intelligence, App Filter Intelligence. Min Term is 12 months. Includes bundled Elite-Plus Support.

Note: Licenses are managed and activated from GigaVUE-FM.

Support and Services

Gigamon offers a range of support and maintenance services. For details regarding the Gigamon Limited Warranty and our Product Support and Software Maintenance Programs, visit gigamon.com/support-and-services/overview-and-benefits.

About Gigamon

Gigamon offers a deep observability pipeline that harnesses actionable network-derived intelligence to amplify the power of observability tools. This powerful combination helps IT organizations to assure security and compliance governance, speed root-cause analysis of performance bottlenecks, and lower operational overhead associated with managing hybrid and multi-cloud IT infrastructures. The result: modern enterprises realize the full transformational promise of the cloud. Gigamon serves more than 4,000 customers worldwide, including over 80 percent of Fortune 100 enterprises, nine of the 10 largest mobile network providers, and hundreds of governments and educational organizations worldwide. To learn more, please visit gigamon.com.
